

Independent membrane labels registered onto the phase grid (scale $1.3438 = 0.284871/0.211994$, offset 314,280)

median Dice against the phase-threshold labels 0.574. The membrane mask is PROVISIONAL: stain marks the perimeter, so a threshold returns rings and filling them leaks where they open.

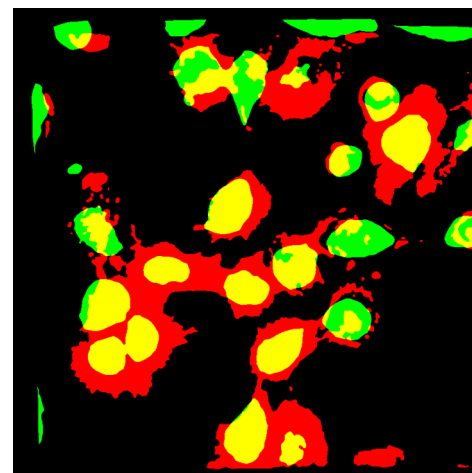

NCI_01
quantitative phase

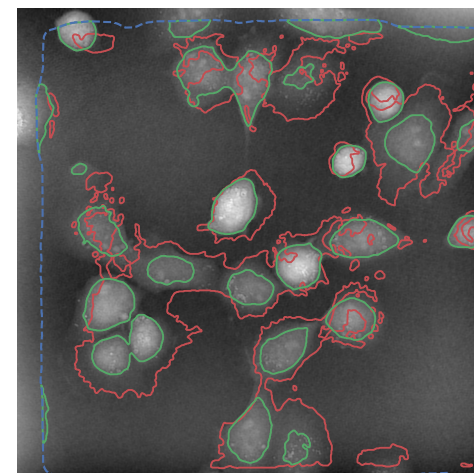

membrane, warped to the phase grid

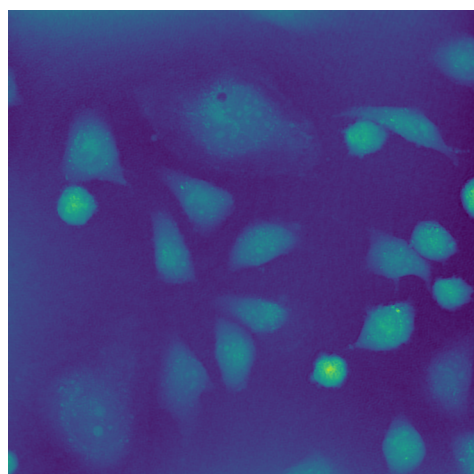

red = membrane green = phase Otsu
yellow = agree Dice 0.501

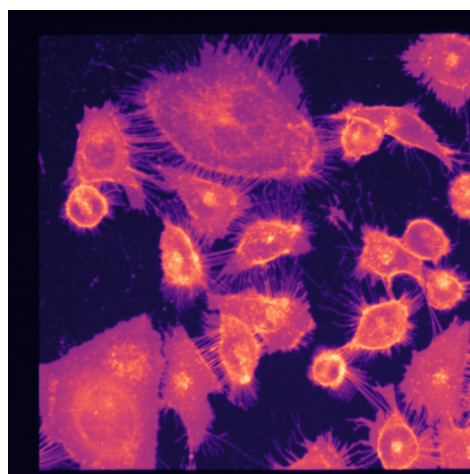

contours on the phase
(blue dashed = illuminated window)

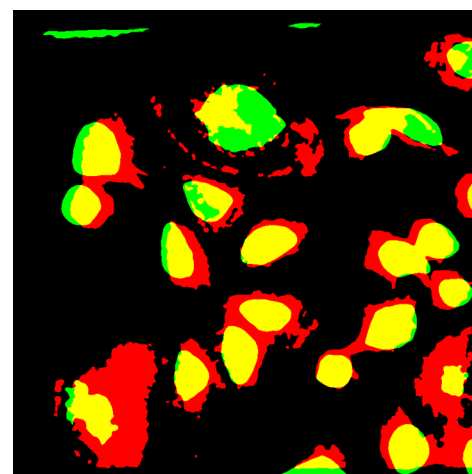

NCI_02
quantitative phase

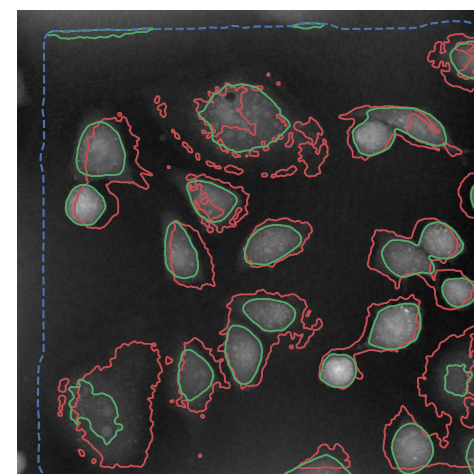

membrane, warped to the phase grid

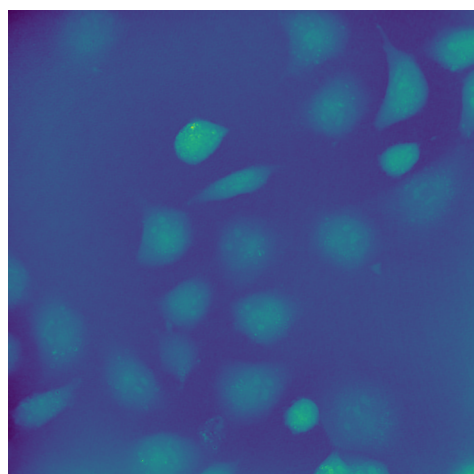

red = membrane green = phase Otsu
yellow = agree Dice 0.574

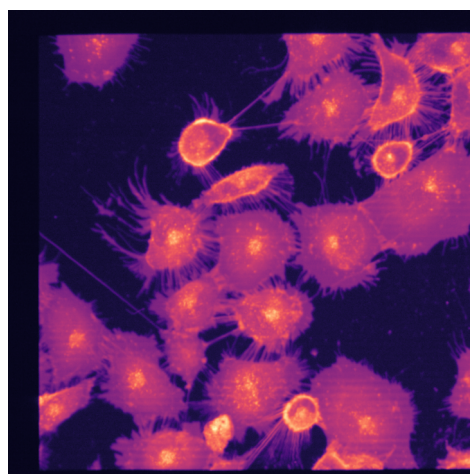

contours on the phase
(blue dashed = illuminated window)

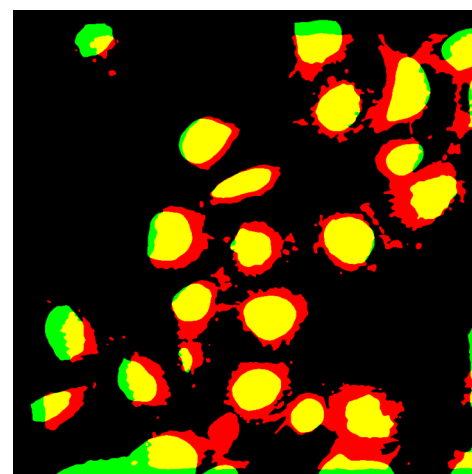

NCI_03
quantitative phase

membrane, warped to the phase grid

red = membrane green = phase Otsu
yellow = agree Dice 0.608

contours on the phase
(blue dashed = illuminated window)
